OPERATIONAL · AUDIT · COST

Cash Accountability System redesign

Functional-to-technical change request
CAS–ERP interface and Fund Balance with Treasury

Executive context

The Agency requires standardized, system-driven business processes to identify, record, and track all collections and disbursements transmitted to ERP and ultimately reported to the U.S. Treasury. These processes are essential to reconciling cash activity and ensuring the accuracy of the General Ledger and Fund Balance with Treasury (FBwT).

ERP records the financial impact of the Agency's General Fund transactions, including cash activity. CAS consolidates and transmits disbursing transactions from multiple systems to Treasury. Entitlement and billing systems—including ADS, CPS, DTS, ODS, and IPAC—also generate cash transactions that flow into ERP; CAS aggregates their disbursement and collection data into a single Treasury-facing report.

Process and system gaps hinder timely, accurate recording of cash transactions from external disbursing systems. As a result, the Agency lacks a reliable, consolidated, real-time view of its cash position and FBwT balances.

Change agenda

Align the CAS interface to SFIS 10.0; automate 11 manual business activities; strengthen matching, transaction visibility, and reconciliation controls.

Document basis: reformatted from *Case-1359-OAC-DCAS.pdf*. Historical figures and audit references are retained as supplied; they are not a statement of current operating conditions.

01 · AGENCY ENTERPRISE IMPACT

Restore interface compliance. Protect financial data integrity.

Consolidate the SFIS-related enhancements under the broader Case 1359 requirements.

Current-state compliance gap

The CAS file transmitted to ERP does not comply with the Chart of Accounts (COA) 10.0 Maintenance Release (MR) SFIS attribute structure mandated by Oversight Office. The Agency must coordinate with the CAS PMO to update the interface file to SFIS 10.0 requirements.

A key SFIS 10.0 update changes the fund master data structure. ERP is already SFIS 10.0 compliant; receiving non-compliant CAS data generates errors that force ERP to revert master data to a pre-SFIS 10.0 configuration.

Related case	Scope to consolidate into Case 1359
GATE #1207 SFIS 10 MR Phase I	Upgrade all ERP interfaces to SFIS 10.0 MR.
GATE #1361 SFIS 10 MR Phase II	Update the population of specific SFIS attributes, including the disbursement-versus-collection rules below.

Account / activity	BA, BSA, BLI, BALI
1010.0120 · FBwT Disbursements	Values required
1010.0110 · Collections	Fields must remain blank

Policy basis and intended effect

The Oversight Office memorandum, *Fiscal Year 2016 Chart of Accounts Standard Financial Information Structure 10.0 Maintenance Release Attribute Alignment File*, establishes mandatory SFIS 10.0 data and configuration standards.

Compliance is intended to improve accounting-system and Treasury interoperability, strengthen financial data and reporting accuracy, and reduce manual and automated journal vouchers in support of audit readiness.

02 · BUSINESS PROCESS CHANGES

Automate the manual transaction population.

The consolidated Treasury report must include all cash disbursement and collection activity within the Agency General Fund (AGF). The Agency lacks an automated process for several miscellaneous activities, and the existing CAS-to-ERP transfer method does not provide sufficient visibility or traceability to reliably identify, track, and reconcile them.

Activities currently entered manually into ERP

No.	Business activity
01	Salary advances and collections
02	Living Quarters Allowance (LQA) advances
03	Miscellaneous payroll vouchers
04	Energy Savings Performance Contract rebates
05	MERHCF receipts and collections
06	Debt collections
07	PAX travel
08	EFT returns
09	State Department vouchers with FLUX
10	TDP Loss Breakage (bulk billing)
11	Canceling-year IDOCs/UMTs

Required business process change

Design and implement standardized processes for the automated ingestion, classification, and posting of these collection and disbursement activities.

Automating this population is intended to strengthen cash accountability, improve reconciliation accuracy, and enhance the completeness of Treasury reporting.

03 · TRANSACTION COUNT, VOLUME & VALUE

Historical scale of the reconciliation challenge.

June 2017 populations and FY17 CAS ID outcomes, as supplied.

FAILED CAS IDOCS

169K

$1.5B absolute value

Results in transit and undistributed to ERP for financial reporting.

UMTS

150K

$2.5B absolute value

Unmatched transactions as of June 2017.

FY17 reconciliation outcomes · CAS ID indicators

Indicator	Source classification	Share
B	Unmatched (To-Be-Posted)	14.16%
C	Matched (To-Be-Posted); Initial Unmatched	15.74%
D	Pre-Posted (Verified-To-Be-Posted)	24.43%
A	Matched (To-Be-Posted)	45.66%

Source chart shares total 99.99%. The source does not link them to the June 2017 population totals; no combined total is inferred.

Source risk framing · conceptual, not a measured plot

The original graphic juxtaposes IDOC transaction volume (top), UMT transaction volume (bottom), control/process maturity (left), and financial risk (right).

Upper-left High IDOC count, low value	**Upper-right** High IDOC value, high risk
Lower-left High UMT value, low control	**Lower-right** High UMT count, manageable

04 · CURRENT STATE ANALYSIS

Close the reconciliation and status-feedback gaps.

Time-outs increase the unmatched population

A significant number of ERP disbursement and collection vouchers are forced to post as UMTs and are later cleared through the recycle program. These UMTs arise primarily from ERP connection time-outs when posting vouchers to the corresponding CAS disbursing record.

The time-out safeguard prevents individual requests from consuming excessive system resources, but also causes incomplete postings and increases UMT volume. Reducing vouchers routed to UMT status is expected to improve recycle-program performance and decrease unresolved-error backlogs.

Matched transactions are not transmitted back to CAS

When a transaction initially classified as a UMT is later matched to an ERP voucher, it must be reclassified to matched status. These reclassified transactions and required adjustment records—such as a post-1081 adjustment—are not transmitted back to CAS. CAS therefore lacks visibility into the current status of outstanding liabilities and actual disbursements, creating cash-accountability discrepancies.

IG Memorandum 2017-069

Ineffective Fund Balance with Treasury Reconciliation Process for Agency General Fund recommends reengineering the GF FBwT reconciliation process to:

1. Identify, age, assign, and explain differences within **10 workdays after month-end**.
2. Research and resolve all differences within **60 days**.
3. Document business rules supporting system-generated adjustments.
4. Support all adjustments with transaction-level detail.
5. Implement system changes to standardize posting logic across non-legacy accounting systems.
6. Establish a methodology to standardize data from legacy systems.
7. Enable system functionality demonstrating consistent posting logic across all non-legacy systems.

05 · ERROR & RE-WORK REDUCTION

Make matching logic and exception routing visible.

The CAS-to-ERP interface creates an internal reconciliation table between specified CAS disbursing records and ERP vouchers. This file/table, known as the **CAS ID**, provides status indicators reflecting reconciliation outcomes. The FY17 indicator distribution is retained on page 4.

Reference numbers used to match incoming transactions

Acquisition Request Number (ARN)	Vendor Invoice Number
MILSTRIP Number	Travel Order Number
Reimbursable Bill Number	Document/Record Reference Number

The interface uses one or more of these references to determine how each incoming CAS transaction should be processed and to identify the appropriate ERP voucher.

Current unmatched-transaction path

1 · Match fails
Reference match fails or fund amount mismatch is detected.

→

2 · Route exception
Record mismatch reason in custom 1081 table; add item to UMT table.

→

3 · Recycle
Use automated and manual reconciliation to research and resolve items.

The CAS ID program classifies these items as unmatched financial documents. The dedicated UMT table feeds the recycle program, enabling ERP personnel to research and resolve outstanding unmatched transactions.

Visibility limitation

The CAS ID table does not include the IDOC number. The source also proposes incorporating the IDOC status code to help researchers assess transaction status and disposition across the FBwT population.

06 · IDOC STATUS & CONCURRENT CHANGES

Strengthen transaction research and posting controls.

The IDOC number is a temporary document identifier assigned to all transactions attempting to post in ERP. Failed IDOCs (**Status 51**) represent disbursement or collection vouchers not successfully recorded against cash accounts.

In addition to assigning an IDOC number, the interface applies a status code and description to each transaction. These codes help researchers understand the issue and determine corrective action.

Code	Description	Action required
51	IDOC in suspended status; not recorded in financial system.	Pull IDOC to obtain additional information and resolve the problem.
53	IDOC posted successfully; results reflected in ERP.	No action required.
64	Transaction not processed; waiting for batch job.	No action required.
68	IDOC not processed; marked for no further processing.	More information needed; usually no action required.

Duplicate-invoice and concurrent-edit exposure

The CAS-to-ERP interface does not prevent scenarios in which a vendor locks a funds commitment document and subsequently creates a duplicate invoice. This typically occurs when multiple users attempt to modify the same document simultaneously.

Current workaround

The interface examines all purchase order documents for attempted user changes sharing specific data elements, such as vendor name and purchase order amount. When those criteria are detected, it automatically locks the invoice to prevent concurrent edits by multiple users.

Control limitation: the workaround mitigates duplicate-invoice creation but remains reactive. It does not fully resolve the underlying interface and process deficiencies.

07 · NFRS, PROCESS EFFICIENCIES & COST AVOIDANCE

Link remediation to value.

NFR T-2017-05 · Unsupported Departmental Reporting Adjustment

This finding identifies unsupported adjustments in the Agency's Fund Balance with Treasury Tool (AFT) when recorded in Departmental Reporting. The redesign is intended to support remediation by identifying root causes of recurring FBwT differences, resolving discrepancies before reporting deadlines, and establishing controls to prevent future variances.

NFR F-2017-10 · Departmental JV Management Review

This finding advises collaboration with responsible system owners to correct systemic issues triggering failed edit checks and to improve source general ledger systems feeding Departmental Reporting. Complete, accurate, detailed financial information is intended to reduce journal-voucher volume and improve downstream reporting reliability.

Process efficiencies

Reducing UMTs requiring manual intervention would allow resources to focus on the root causes of truly unknown UMTs. Greater automation would reduce dependence on manual research and correction.

Adding the IDOC status code to the CAS ID table would improve researchers' visibility into status and disposition across the FBwT population. Faster transitions from unmatched to matched status, combined with stronger IDOC-resolution processes, would improve FBwT reporting accuracy, completeness, and overall cash accountability.

Cost avoidance

Automating correction processes for the 11 known miscellaneous manual activities could allow the Agency to reprioritize existing personnel and obtain more value from services already funded. Reducing month-end effort on IDOC errors and UMTs could also allow personnel to transition to other service areas.

Review conclusion · functional-to-technical handoff

The source defines business and control needs, not build-ready specifications. Field-level mappings, processing design, acceptance criteria, delivery timing, and quantified savings are not supplied. This edition infers no values or approvals.
